

Big Muff* style fuzz inspired by the mid 1970's era with thick tone, huge sustain, and a warm, soft attack like the vintage units

SUSTAIN: This controls the intensity of the fuzz. Hottest distortion flavor will be found at max with plenty of warm, gooey sustain throughout its range.

VOLUME: Big sound with massive volume boost available. Unity gain should be found around noon.

TONE: Thick full-range sound with an extra-wide range instead of a small sweet spot and plenty of useful tones throughout. This tone control is not mid-scooped but gives you a juicy sound with remarkable openness.

*Big Muff Pi is a trademark of Electro-Harmonix, Inc, and is only being used here as a reference for comparison

Power

All Skreddy Pedals accept the industry-standard 9v DC plug (5.5mm barrel x 2.1mm center coax), with the center being negative and the barrel being positive. Please use a quality, regulated, filtered power supply.

9v battery is not included. To install or change a battery, remove the bottom cover using a Phillips screwdriver. To prevent a battery (if you use one) from draining while the pedal is not in use, remember to un-plug the input cable from the pedal's input jack. The battery is also disconnected from the circuit when an adapter is plugged into the DC jack.

Power consumption: about 2mA @ 9 volts

Battery

Please use Energizer® brand batteries for best fit. Other brands tend to be bigger and may not leave enough room for the edges of the lid to fit.

Service

Email Skreddy Pedals at marc@skreddypedals.com if your pedal needs repair..
